FXSA.ME

1. Go to the **MQL4** folder and copy there all the files from the MQL4 folder which you received.

After that, restart the terminal.

2. Go to the terminal settings. Service - settings - advisers

And check all the boxes as on the screen.

FXSA.ME

Advisor working principle:

The EA works on the basis of two indicators with non-standard parameters. Not like you used to use them.

Indicators are built into the EA and generate signals understandable for Advisor.

Technically, the adviser sees the chart like this:

For the user, we removed this display.

First comes the analysis of higher timeframes to determine the global trend. Further, the adviser waits for signals on a lower timeframe. IN Advisor implemented 2 modes of work.

Mode 1 is a fast signal input and global signal close to turn a big trend. Profit in this case is obtained many times more, but the drawdown in equity will be greater as the price goes 100-200 points up and down until it closes in the one we need direction.

FXSA.ME

Mode 2 is the opening and closing of "fast" deals.

Opened a position by a quick signal and quickly closed it by a reverse signal.

Example of opening deals on SELL:

FXSA.ME

Example of opening deals on BUY:

Advisor Parameters:

FXSA.ME

Signal - The values of the indicator emitting signals. Need to set values from 10 to 150. The lower the value, the more signals and the lower is their accuracy.

10 - many signals, low accuracy

100 - few signals, high accuracy

Magician number. Any unique number, the main thing is that in different pairs there were different numbers.

Page 8

Additional points to order - The value in points, the distance to the pending orders when a signal appears.

Mode close. Mode 1 is fast signal input and close by global trend reversal.

Mode 2 is an input for fast signals and a close for fast signals.

Percent profit close - profit as a percentage of the deposit at which everything orders will be closed.

Percent loss close loss as a percentage of the deposit at which all orders will be closed.

Fixet lot - initial lot. If you put 0, then the initial lot is calculated as a percentage of the deposit.

Percent from equity - The initial lot as a percentage of the deposit.

Add to next order - add this value to the next lot.

This parameter works in conjunction with the risk value.

Risk - Risk from 1 to 10. If you put 1 this is the maximum risk. If to put 10 is the minimum risk.

Lot Settings

We recommend placing a dynamic lot (as a percentage of the deposit) and the risk is not less than 7-10.

Advisor works on any currency pairs. The only thing is not forget to change **MAGIC** on each pair . **That there was no**

one identical magic number.

Capital Management

The biggest problem of any trader is greed. For due to excess risks, most traders merge. Even to a broker no need to put sticks in the wheels, the greed of the trader will do everything for him.

How to optimally choose the number of currency pairs?

Page 9

For example, you want to use moderate settings for 4 currency in pairs.

Doing testing for example on EURUSD, it shows that maximum drawdown 50%.

If you set the same settings for 4 pairs, the total drawdown will be make up 200%, and this is a drain of the deposit.

How to do it right?

We take the same settings and reduce the risk using the parameters corresponding to per lot.

For instance :

Percent from equity - The initial lot as a percentage of the deposit. You had set to 1%. In order to bet on 4 pairs, we reduce this the parameter is at 4 and we get 0.25.

You can also increase the Risk parameter. For example, you have installed value 5. Set the value to 1 and your drawdown will decrease.

FXSA.ME

Best timeframe for H1 test results

It is important before starting a trade !!!

1. Make sure that your account has been activated, this will be written in graph work window

If there is no such label, contact support

Page 10

Solution of problems:

1. Advisor is not activated.

You received a message from support that your account has been activated and received the archive with the adviser, installed it as in the instructions, but activation not.

1. Check in the terminal settings all the checkboxes allowing trade and allowing import dll

FXSA.ME

2. It helps in most cases.

Remove the adviser from the chart.

Delete the chart itself.

Close the Metatrader 4 terminal.

Right-click on the terminal's shortcut and select - start from administrator name.

After that, reinstall the adviser.

2. More than a day has passed, but you did not receive a letter saying that your account activated.

Most likely the letter got into the spam folder. Browse the folder first
 spam Mailbox owners on mail.ru always find messages in the spam folder.
 Many are already used to it.

3. If you need fast account activation

Call support and ask for a quick
 activation.

4. How to understand what quotes do you have?

Open the EURUSD chart. If 4 digits after the decimal point. So 4 significant
 quotes. If 5 digits after the decimal point means 5 digits.

FXSA.ME

4 digit quotes

5 digit quote

Many people ask, and if on EURJPY 3 digits after the decimal point are 3 x digits
 quotes?

Not. If you have 4-digit quotes for EURUSD, it means throughout the terminal
 4 digit quotes will be considered.
